NANYANG TECHNOLOGICAL UNIVERSITY

SEMESTER II EXAMINATION 2023-2024

MH1820 Introduction to Probability and Statistical Methods

April/May 2024 Time allowed: 2 hours

INSTRUCTIONS TO CANDIDATES

1. This examination paper contains **FOUR (4)** questions and comprises **SEVEN (7)** printed pages, including the Appendix.
2. Answer **ALL** questions. The marks for each question are indicated at the beginning of each question.
3. Answer each question beginning on a **FRESH** page of the answer book.
4. This is a **RESTRICTED OPEN BOOK** exam. You are only allowed to bring into the examination hall **ONE DOUBLE-SIDED A4-SIZE REFERENCE SHEET WITH TEXTS HANDWRITTEN OR TYPED ON THE A4 PAPER WITHOUT ANY ATTACHMENTS** (e.g. sticky notes, post-it notes, gluing or stapling of additional papers).
5. Tables of some probability distributions are provided in the Appendix on Page 4-7.
6. Candidates may use calculators. However, they should write down systematically the steps in the workings.

QUESTION 1. **(30 Marks)**

(a) Let X be a continuous random variable with PDF given by

$$f(x) = \begin{cases} Cx^4, & \text{for } 0 \leq x \leq 2, \\ 0, & \text{otherwise.} \end{cases}$$

(i) What is the value of C?

(ii) Compute $\mathbb{E}[X]$ and $\mathrm{Var}[X]$.

(b) If X has a normal distribution with mean $\mu = 2$ and variance $\sigma^2 = 4$, find $\mathbb{P}(|X-2| > 4)$ in terms of $\Phi(z)$, the CDF of the standard normal random variable Z.

(c) Two fair dice, A and B, are rolled independently. Suppose that possible outcomes are denoted by (a, b), where a and b are the values on dice A and B respectively. Let X be the largest value obtained, and Y be the sum of the values on the two dice. For example, if the outcome is $(2, 5)$, then $X = 5$ and $Y = 7$; if the outcome is $(3, 3)$, then $X = 3$ and $Y = 6$, etc.

(i) Compute the moment generating function (MGF) of X.

(ii) Find the joint probability mass function (PMF) of X and Y.

QUESTION 2. **(20 Marks)**

(a) Suppose that the monthly income of an investment plan is normally distributed with mean μ and variance σ^2. A financial advisor claims that $\mu = \$50$. A sample of $n = 12$ monthly incomes of the investment plan yielded an average of \$52 and standard deviation of \$5.

(i) Suppose σ is unknown. Test the null hypothesis H_0: $\mu = \$50$ against the alternative hypothesis H_1: $\mu > \$50$, with a significance level of $\alpha = 0.05$.

(ii) Suppose $\sigma = 10$. Let $X_1, X_2, \ldots, X_{12}$ be a random sample from the normal distribution $N(\mu, \sigma^2 = 10^2)$. Consider a test for $H_0 : \mu = \$50$ against the alternative hypothesis $H_1 : \mu = \$60$ based on the statistic $T = \sum_{i=1}^{12} X_i$, where the test rejects H_0 if and only if $T \geq \$660$. What is the power of the test?

(b) You suspect that the probability of rolling a '1' on a die is smaller than $\frac{1}{6}$. You continually roll the die until you get a '1', and this happens after you have rolled 11 times, i.e. you see '1' for the first time on the 11th roll. Based on this observation, is your suspicion correct? Justify your answer with a hypothesis testing with a significance level of $\alpha = 0.05$. (Hint: If T is the number of rolls until the first '1' is observed, then $T \sim Geom(p)$, where p is the probability of rolling a '1' on the die.)

QUESTION 3. **(25 Marks)**

(a) The joint PDF of two random variables X and Y is given by

$$f(x,y) = \begin{cases} \frac{1}{4}\left(3x^2 + 2xy\right), & 0 \le x \le 1,\ 0 \le y \le 2; \\ 0, & \text{elsewhere.} \end{cases}$$

(i) Find the marginal PDFs of X.

(ii) Compute $\mathbb{E}[Y|X=1]$.

(iii) Compute $\mathbb{P}(Y+X>2)$.

(b) You and two other people are to place bids for an object, with the highest bid winning (assume that no one wins if there are more than one person with the highest bid). If you win, you plan to sell the object immediately for \$23. How much should you bid to maximize your expected profit if you believe that the bids of the other two people can be regarded as being independent of each other, and are uniformly distributed between \$20 and \$24?

QUESTION 4. **(25 Marks)**

(a) Let $X_1, \ldots, X_n$ be i.i.d from the exponential distribution $Exp(\theta)$, where $\theta > 0$ is unknown. Find the maximum likelihood estimator for θ based on the observations $x_1 = 2$, $x_2 = 3$, $x_3 = 4$, $x_4 = 5$ (here $n = 4$). (Recall that the PDF of $Exp(\theta)$ is given by $f(x|\theta) = \frac{1}{\theta}e^{-x/\theta}$ for $x > 0$, and $f(x|\theta) = 0$ otherwise.)

(b) Let D_θ, $0 < \theta < 1$, be the discrete distribution with the following PMF:

x	1	2	3
$p(x)$	$\theta/4$	$1-3\theta/4$	$\theta/2$

Let $X_1, \ldots, X_n$ be i.i.d drawn from D_θ. Consider an estimator for θ given by

$$\widehat{\theta} = \frac{1}{n}\sum_{i=1}^{n} X_i^2 - 4.$$

(i) Compute the bias and standard error for $\widehat{\theta}$.

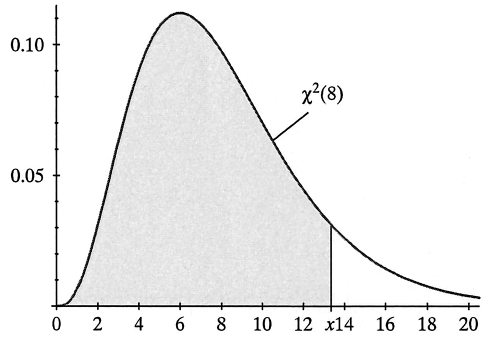
(ii) Find $\widehat{\theta}$ using the observations $x_1 = 1$, $x_2 = 2$, $x_3 = 2$, $x_4 = 3$ (here $n = 4$).

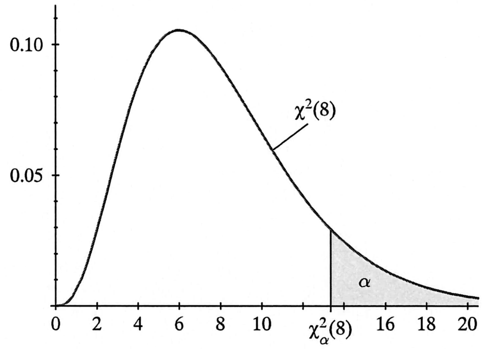
(iii) Find an estimator of θ which is unbiased, i.e. it has zero bias.

END OF PAPER

Appendix

Table IV The Chi-Square Distribution





$$P(X \le x) = \int_0^x \frac{1}{\Gamma(r/2)2^{r/2}} w^{r/2-1} e^{-w/2} dw$$

This table is taken from Table III of Fisher and Yates: *Statistical Tables for Biological, Agricultrual, and Medical Research*, published by Longman Group Ltd., London (previously published by Oliver and Boyd, Edinburgh).

MH1820 INTRODUCTION TO PROBABILITY & STATISTICAL METHODS

Please read the following instructions carefully:

1. **Please do not turn over the question paper until you are told to do so. Disciplinary action may be taken against you if you do so.**

2. You are not allowed to leave the examination hall unless accompanied by an invigilator. You may raise your hand if you need to communicate with the invigilator.

3. Please write your Matriculation Number on the front of the answer book.

4. Please indicate clearly in the answer book (at the appropriate place) if you are continuing the answer to a question elsewhere in the book.
